

How to assign user privilege from Free RADIUS?

In this scenario, we would like to configure the switch & RADIUS to give different privilege by using user ID/password.

a.) The D-Link vendor ID and Privilege setting:

- D-Link's Vendor ID = 171

Table **Błąd! Nie zdefiniowano zakładki.** The supported VSA

Category	Attribute Name	Vendor Type	Type	Value
General	User Level	1	integer	3 for user level, 4 for operator level and 5 for administrator level
General	Ingress Bandwidth Assignment	2	Integer	Kbits/s (0 means no limit)
General	Egress Bandwidth Assignment	3	Integer	Kbits/s (0 means no limit)
General	802.1p priority	4	Integer	0 – 7

Network topology:

PC(192.166.12.100)---DES3526(192.166.12.211)---GW(192.166.12.200)--
RADIUS(192.166.12.132)

a.) Configuration on switch:

```
config ipif System ipaddress 192.166.12.211/24
create iproute default 192.166.12.200

enable authen_policy
create authen server_host 192.166.12.132 protocol radius port 1812 key "123456" timeout 5
retransmit 2
config authen server_group radius delete server_host 192.166.12.132 protocol radius
config authen server_group radius add server_host 192.166.12.132 protocol radius
create authen_login method_list_name radius
config authen_login method_list_name radius method radius
config authen_enable default method local_enable
config authen application telnet login method_list_name radius
config authen application telnet enable default
config authen parameter response_timeout 0
config authen parameter attempt 3
config authen enable_admin all state enable
```

b.) Free RADIUS configuration

```
# cat /usr/local/etc/raddb/dictionary
#
#      This is the master dictionary file, which references the
#      pre-defined dictionary files included with the server.
#
#      Any new/changed attributes MUST be placed in this file, as
#      the pre-defined dictionaries SHOULD NOT be edited.
#
#      $Id: dictionary.in,v 1.4 2004/04/14 15:26:20 aland Exp $
#
#
#      The filename given here should be an absolute path.
#
$INCLUDE      /usr/local/share/freeradius/dictionary
$INCLUDE      /usr/local/share/freeradius/dictionary.dlink

# cat /usr/local/share/freeradius/dictionary.dlink
#####
# D-link Dictionary file
#####

VENDOR  D-LINK  171

#
# User group attribute
#

BEGIN-VENDOR  D-LINK

ATTRIBUTE    User-Level 1      integer
ATTRIBUTE    Ingress-Bandwidth-Assignment 2      integer
ATTRIBUTE    Egress-Bandwidth-Assignment 3      integer
ATTRIBUTE    802-1p     4      integer

END-VENDOR  D-LINK

# cat /usr/local/etc/raddb/users
dlink-3      Cleartext-Password := "dlink-3"
              User-Level = "3"

dlink-4      Cleartext-Password := "dlink-4"
              User-Level = "4"

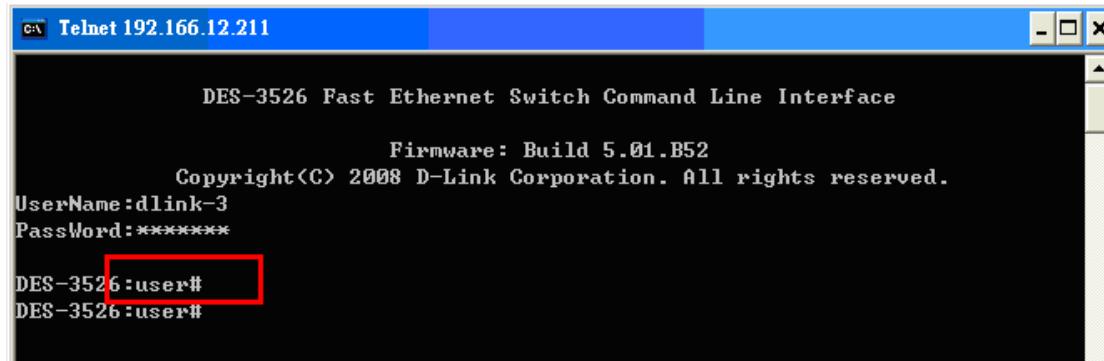

dlink-5      Cleartext-Password := "dlink-5"
              User-Level = "5"
```

c.) Verification: How user get different privilege by user name & password

There are 3 accounts created in the Radius server

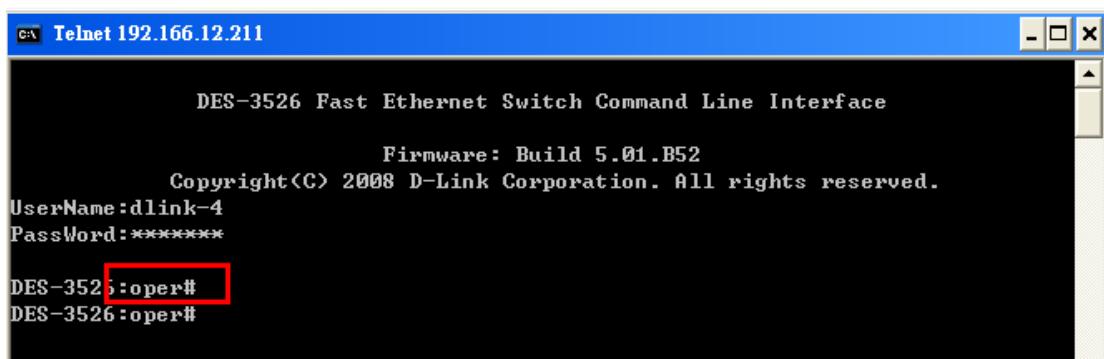

- 1.) User privilege (ID/password) dlink-3/dlink-3
- 2.) Operator privilege (ID/password) dlink-4/dlink-4
- 3.) Admin privilege (ID/Password) dlink-5/dlink-5

a.)when you telnet into to the switch's IP, enter user privilege ID/password. You will see the prompt is shown 'user' as below

A screenshot of a Windows Telnet window titled "Telnet 192.166.12.211". The window displays the DES-3526 Fast Ethernet Switch Command Line Interface. It shows the following text:
