First child	None
Description	<p>The time-to-live value expressed as a multiple of the lldpMessageTxInterval object. The actual time-to-live value used in LLDP frames, transmitted on behalf of this LLDP agent, can be expressed by the following formula: TTL = min(65535, (lldpMessageTxInterval * lldpMessageTxHoldMultiplier)) For example, if the value of lldpMessageTxInterval is '30', and the value of lldpMessageTxHoldMultiplier is '4', then the value '120' is encoded in the TTL field in the LLDP header.</p> <p>The default value for lldpMessageTxHoldMultiplier object is 4.</p> <p>The value of this object must be restored from non-volatile storage after a re-initialization of the management system.</p>

Object name	lldpReinitDelay
Object ID	1.0.8802.1.1.2.1.1.3
Module	LLDP-MIB
Base syntax	Integer
Composed syntax	Integer32
Access	Read-Write
Status	Current
Value list	1 : 1..10
Parent node	lldpConfiguration
First child	None
Description	<p>The lldpReinitDelay indicates the delay (in units of seconds) from when lldpPortConfigAdminStatus object of a particular port becomes 'disabled' until re-initialization will be attempted.</p> <p>The default value for lldpReinitDelay object is two seconds.</p> <p>The value of this object must be restored from non-volatile storage after a re-initialization of the management system.</p>

	Object name	lldpTxDelay
	Object ID	1.0.8802.1.1.2.1.1.4
	Module	LLDP-MIB
	Base syntax	Integer
	Composed syntax	Integer32
	Access	Read-Write
	Status	Current
	Value list	1 : 1..8192
	Parent node	IldpConfiguration
	First child	IldpTxDelay
	Description	The IldpTxDelay indicates the delay (in units of seconds) between successive LLDP frame transmissions initiated by value/status changes in the LLDP local systems MIB. The recommended value for the IldpTxDelay is set by the following formula: $1 \leq IldpTxDelay \leq (0.25 * IldpMessageTxInterval)$
		The default value for IldpTxDelay object is two seconds.
		The value of this object must be restored from non-volatile storage after a re-initialization of the management system.

	Object name	lldpNotificationInterval
	Object ID	1.0.8802.1.1.2.1.1.5
	Module	LLDP-MIB
	Base syntax	Integer
	Composed syntax	Integer32
	Access	Read-Write
	Status	Current
	Value list	1 : 5..3600
	Parent node	IldpConfiguration
	First child	IldpNotificationInterval
	Description	This object controls the transmission of LLDP notifications. <p>the agent must not generate more than one IldpRemTablesChange notification-event in the indicated period, where a 'notification-event' is the transmission of a single notification PDU type to a list of notification destinations. If additional changes in IldpRemoteSystemsData object groups occur within the indicated throttling period, then these trap- events must be suppressed by the agent. An NMS should periodically check the value of IldpStatsRemTableLastChangeTime to detect any missed IldpRemTablesChange notification-events, e.g. due to throttling or transmission loss.</p>
		If notification transmission is enabled for particular ports, the suggested default throttling period is 5 seconds.
		The value of this object must be restored from non-volatile storage after a re-initialization of the management system.

Base syntax Integer

Composed syntax BITS

Access Read- Write

Status Current

Parent node lldpPortConfigEntry

First child None

Description The lldpPortConfigTLVsTxEnable, defined as a bitmap, includes the basic set of LLDP TLVs whose transmission is allowed on the local LLDP agent by the network management. Each bit in the bitmap corresponds to a TLV type associated with a specific optional TLV.

It should be noted that the organizationally-specific TLVs are excluded from the lldpTLVsTxEnable bitmap.

LLDP Organization Specific Information Extension MIBs should have similar configuration object to control transmission of their organizationally defined TLVs.

The bit 'portDesc(0)' indicates that LLDP agent should transmit Port Description TLV.

The bit 'sysName(1)' indicates that LLDP agent should transmit System Name TLV.

The bit 'sysDesc(2)' indicates that LLDP agent should transmit System Description TLV.

The bit 'sysCap(3)' indicates that LLDP agent should transmit System Capabilities TLV.

There is no bit reserved for the management address TLV type since transmission of management address TLVs are controlled by another object, lldpConfigManAddrTable.

The default value for lldpPortConfigTLVsTxEnable object is empty set, which means no enumerated values are set.

The value of this object must be restored from non-volatile storage after a re-initialization of the management system.

<p>The MIB browser interface displays the LldpConfigManAddrTable object and its sub-objects. The tree view on the left shows the following structure:</p> <ul style="list-style-type: none"> LldpPortConfigTLVsTxEnable LldpConfigManAddrTable <ul style="list-style-type: none"> LldpConfigManAddrEntry <ul style="list-style-type: none"> LldpConfigManAddrPortsTxEnable LldpStatistics <ul style="list-style-type: none"> LldpStatsRemTablesLastChangeTime LldpStatsRemTablesInserts LldpStatsRemTablesDeletes LldpStatsRemTablesDrops LldpStatsRemTablesAgeouts LldpStatsTxPortTable <ul style="list-style-type: none"> LldpStatsTxPortEntry <ul style="list-style-type: none"> LldpStatsTxPortNum LldpStatsTxPortFramesTotal LldpStatsRxPortTable <ul style="list-style-type: none"> LldpStatsRxPortEntry <ul style="list-style-type: none"> LldpStatsRxPortNum LldpStatsRxPortFramesDiscardedTotal LldpStatsRxPortFramesErrors LldpStatsRxPortFramesTotal LldpStatsRxPortTLVsDiscardedTotal LldpStatsRxPortTLVsUnrecognized LldpStatsRxPortAgeoutsTotal 	<p>Object name: lldpConfigManAddrTable Object ID: 1.0.8802.1.1.2.1.1.7 Module: LLDP-MIB</p> <p>Base syntax: Sequence Of lldpConfigManAddrEntry Access: Not_Accessible Status: Current Description: 1:LldpConfigManAddrPortsTxEnable - Octet String</p> <p>Parent node: lldpConfiguration First child: lldpConfigManAddrEntry Description: The table that controls selection of LLDP management address TLV instances to be transmitted on individual ports.</p>

lldpLocManAddr	Object name	lldpLocManAddr
	Object ID	1.0.8802.1.1.2.1.3.8.1.2
	Module	LLDP-MIB
	Base syntax	Octet String
	Composed syntax	LldpManAddress
	Access	Not_Accessible
	Status	Current
	Value list	1 : 1..31
	Parent node	lldpLocManAddrEntry
	First child	None
lldpLocManAddr	Description	The string value used to identify the management address component associated with the local system. The purpose of this address is to contact the management entity.

lldpLocManAddrLen	Object name	lldpLocManAddrLen
	Object ID	1.0.8802.1.1.2.1.3.8.1.3
	Module	LLDP-MIB
	Base syntax	Integer
	Composed syntax	Integer32
	Access	Read-Only
	Status	Current
	Parent node	lldpLocManAddrEntry
	First child	None
lldpLocManAddrLen	Description	The total length of the management address subtype and the management address fields in LLDPDUs transmitted by the local LLDP agent.
		The management address length field is needed so that the receiving systems that do not implement SNMP will not be required to implement an iana family numbers/address length equivalency table in order to decode the management address.

lldpLocManAddrIfSubtype	Object name	lldpLocManAddrIfSubtype
	Object ID	1.0.8802.1.1.2.1.3.8.1.4

	Value list	1 : 1..2147483647
	Parent node	lldpRemEntry
	First child	None
Description		
This object represents an arbitrary local integer value used by this agent to identify a particular connection instance, unique only for the indicated remote system.		
An agent is encouraged to assign monotonically increasing index values to new entries, starting with one, after each reboot. It is considered unlikely that the lldpRemIndex will wrap between reboots.		

	Object name	lldpRemChassisIdSubtype
	Object ID	1.0.8802.1.1.2.1.4.1.1.4

	Value list	1 : 1..255
	Parent node	lldpRemOrgDefInfoEntry
	First child	None
Description		The integer value used to identify the subtype of the organizationally defined information received from the remote system.
		The subtype value is required to identify different instances of organizationally defined information that could not be retrieved without a unique identifier that indicates the particular type of information contained in the information string.

	Object name	lldpRemOrgDefInfoIndex
	Object ID	1.0.8802.1.1.2.1.4.4.1.3
	Module	LLDP-MIB
	Base syntax	Integer
	Composed syntax	Integer32
	Access	Not_Accessible
	Status	Current
	Value list	1 : 1..2147483647
	Parent node	lldpRemOrgDefInfoEntry
	First child	None
Description		This object represents an arbitrary local integer value used by this agent to identify a particular unrecognized organizationally defined information instance, unique only for the lldpRemOrgDefInfoOUI and lldpRemOrgDefInfoSubtype from the same remote system.
		An agent is encouraged to assign monotonically increasing index values to new entries, starting with one, after each reboot. It is considered unlikely that the lldpRemOrgDefInfoIndex will wrap between reboots.

	Object name	lldpRemOrgDefInfo
	Object ID	1.0.8802.1.1.2.1.4.4.1.4
	Module	LLDP-MIB
	Base syntax	Octet String
	Composed syntax	OCTET STRING
	Access	Read-Only
	Status	Current
	Value list	1 : 0..507
	Parent node	lldpRemOrgDefInfoEntry
	First child	None
Description		The string value used to identify the organizationally defined information of the remote system. The encoding for this object should be as defined for SnmpAdminString TC.
